Certainly! Here's a detailed analysis of the speech you shared:

1. Grammar Corrections and Explanations

- Original:** "Now am going to talk about the background of the research."
Correction: "Now I am going to talk about the background of the research."
Explanation: The subject "I" was missing before "am."
- Original:** "Do you know how banks decid who deserves a loan?"
Correction: "Do you know how banks decide who deserves a loan?"
Explanation: The correct form is "decide" (present tense), not "decid."
- Original:** "So, behind this decision, there's something called a credit rating. As I said, it's basically a score that shows us how risky it is to lend money to a person or a company."
Correction: "So, behind this decision, there's something called a credit rating. As I said, it's basically a score that shows how risky it is to lend money to a person or a company."
Explanation: "Shows us" is less formal and unnecessary here. Simply "shows" fits better in informative speech.
- Original:** "If the score is high, it means you're likely to pay the money back, and if it's low, it means lending the money to you could be very risky."
Correction: "If the score is high, it means you're likely to pay the money back, and if it's low, it means lending money to you could be very risky."
Explanation: "Lending the money to you" → "lending money to you" is more concise without losing meaning.
- Original:** "In the past, these credit ratings were calculated in a very simple way. In 1968, a researcher name Edward Altam create something called the Z-score model."
Correction: "In the past, these credit ratings were calculated in a very simple way. In 1968, a researcher named Edward Altman created something called the Z-Score model."
Explanation: The correct verb tense is "created," and the correct researcher's last name is "Altman," not "Altam." Also, "named" instead of "name."
- Original:** "He basically checked a few simple things like how much money the company earn and how much it owe."
Correction: "He basically checked a few simple things, like how much money the company earned and how much it owed."
Explanation: Both verbs need to match the past tense since you're referring to a past event. "Earn" becomes "earned" and "owe" becomes "owed."
- Original:** "This method was easy to understand but it had limitations."
Correction: "This method was easy to understand, but it had limitations."
Explanation: Adding a comma before "but" improves the flow and readability.
- Original:** "Over the last twenty years, everything changed thanks to machine learning."
Correction: "Over the past twenty years, everything has changed thanks to machine learning."
Explanation: "Over the past" sounds slightly more natural when describing a period of time up to the present.
- Original:** "These models can find complex patterns in massive dataset and make really accurate predictions."
Correction: "These models can find complex patterns in massive datasets and make really accurate predictions."
Explanation: The plural form of "dataset" is "datasets."
- Original:** "But there's a problem. They work like black boxes. They tell you the score but not why you got this score."
Correction: "But there's a problem. They work like black boxes. They tell you the score but not why

you got that score."

Explanation: "This" should be replaced by "that" to indicate something already mentioned rather than something immediate.

- **Original:** "The main idea behind explainable artificial intelligence is to make these complex machine learning models transparent to show how each factor, such as your income, level of debt, or payment history, affects your credit score."

Correction: "The main idea behind explainable artificial intelligence is to make these complex machine learning models transparent, to show how each factor—such as your income, level of debt, or payment history—affects your credit score."

Explanation: The list items are better separated by dashes or commas to ensure clarity.

2. Feedback on Pronunciation

- **Most words were pronounced clearly and accurately.**

- A couple of terms might need attention or slower enunciation depending on the audience:
 - **"Machine Learning":** Ensure clear distinction between "ma-chine" and "learn-ing."
 - **"Explainable Artificial Intelligence":** It's a slightly more complex term, so enunciate slowly to avoid confusion among listeners unfamiliar with the topic.

- **Tip:** The pronunciation would benefit from slowing down slightly on longer or technical terms. This helps keep the audience engaged.

3. Feedback on Tone and Emotional Intensity

- **Appropriate tone for an informative presentation:** The tone was neutral and educational, which is ideal when discussing technical or research-oriented subjects.

- **Emotional intensity:** The emotional intensity was balanced. It wasn't flat, nor was it overly intense. This kind of speech benefits from a calm, informative tone because it helps the listener process complex information.

4. Suggestions for Improving Word Choice, Pacing, and Delivery

- **Word Choice:**

- Instead of "very simple way," consider "a straightforward method" to maintain a more formal tone.
- Where you said "like how much money the company earn," you could use "such as" instead of "like" for a more formal presentation.
- Replace "cool" with "important" or "critical" to maintain a professional tone when describing a "credit rating," as "cool" is too casual for a research context.

- **Pacing:**

- The pacing was good for the most part but could be slightly slower on technical terms like "explainable artificial intelligence" and "Z-Score." This would give the audience more time to process the terms.
- Pause slightly before and after key points (for example, before mentioning "explainable artificial intelligence") to highlight important transitions or concepts.

- **Delivery Suggestions:**

- Use slight variations in pitch to emphasize contrasts, for example, when describing the difference between old methods and machine learning-based methods.
 - If you're speaking to a non-technical audience, include brief definitions or elaborations on more technical phrases to ensure greater understanding.
-

5. Summary in Bullet Points

- **Grammar Corrections:**

- Add missing subjects (e.g., "I am going").
- Use correct verb forms (e.g., "decide" instead of "decid").
- Ensure all past events use past tense (e.g., "earned" and "owed").
- Replace casual phrases like "cool" with more formal words like "important" or "critical."

- **Pronunciation:**

- Ensure clear enunciation of technical terms like "machine learning" and "explainable artificial intelligence."
- Consider slowing down slightly for technical segments.

- **Tone and Emotional Intensity:**

- Neutral and educational tone is suitable for research presentations.
- The balance of intensity is appropriate; not too flat or overwhelming.

- **Word Choice, Pacing, and Delivery:**

- Use more formal alternatives to casual language (e.g., "important" instead of "cool").
- Ensure list items are clearly separated (use commas or dashes).
- Slow down when introducing technical phrases and use brief pauses before and after significant concepts.

By applying these adjustments, the speech will sound clearer, more professional, and easier to follow.
